Why is the expired SSL certificate activated every time I run a build in OCLC Hosted EZproxy

Symptom

• When an update is made and a build is run, the old SSL certificate is activated

Applies to

• OCLC Hosted EZproxy

Resolution

1. Load the SSL certificate that keeps needing to be activated to the Pre-Production instance of EZproxy as well

Additional information

If the New SSL certificate is not load to the pre-production instance, the SSL certificate that is active on the pre-production will be active on the production instance when the build is run.
