The NetZero HiSpeed service works with proxy by hostname using port 80, but it does not work with proxy by port and may not work with proxy by hostname using ports other than 80. Use this information to restore EZproxy in NetZero HiSpeed.

In most instances, an icon has appeared in the system tray in the lower-right corner of the screen which contains an option to disable HiSpeed. Using this option enables service for most users.

There have been reports of users for whom this did not work. For those users, the following instructions have provided a work-around:

1. Launch **Internet Explorer**.
2. Go to **Tools > Internet Options**...
3. Click on the **Connections** tab.
4. Scroll through the **Dial-up settings** to locate NetZero, then click on **NetZero** and click **Settings**...
5. Under **Proxy Server**, click **Advanced**...
6. In **Exceptions**, scroll to the end of the list, then type a semi-colon (;) followed by just the host name of the EZproxy server (e.g., ezproxy.yourlib.org). All the other sample entries have an asterisk (*) in front, and although it won't hurt, that isn't required for this entry. Do not include the port number.
7. Click **OK** until all the windows close and you are back in Internet Explorer.
8. At this point, access to EZproxy should be restored.
